How. to build promo listening page

Hi,

We are building a headless setup with dotCMS and Angular and would like to clarify the recommended approach for listing pages that are placed inside a folder.

Our current structure in dotCMS looks like this:

```
/fop
 
  /promo
 
            index.page
              wog.page
                bolt.page
                  pay-with-visa.page
```

The goal is to use `/fop/promo/index` as a **promo listing page** that automatically renders all promo pages inside the `/fop/promo` folder.

What would be the best practice in a **headless Angular + dotCMS setup** to fetch and render all pages located inside a specific folder?

Specifically:

- What is the recommended API (GraphQL / REST / Navigation API) to retrieve all pages within /fop/promo?
- Is there a built-in GraphQL way to query pages by folder path?
- What is the typical pattern used in headless implementations for building folder-based listing pages?

Thanks in advance for the guidance.

Hi Stanislav,

Thank you for getting in touch,

we will investigate this matter and inform you of the best practices for fetching the pages and addressing your inquiries.

Best Regards,
